

U.S. Equity Podcast Data Feed

Context Analytics Podcast Data Feed scans podcasts across the Business, Finance, News, and Technology categories to identify mentions of publicly traded companies, enabling quantitative analysis of podcast-driven sentiment for financial securities.

Each episode is transcribed and processed to detect references to individual securities. For every company mentioned within an episode, a company-specific summary is generated. Our proprietary Natural Language Processing model analyzes each company-level summary to calculate the sentiment metrics.

Universe: U.S. Equities. 2016-01-01 to Present

Data Delivery: CA's data feeds are available through a RESTful JSON API or as FTP files. The data is delivered in JSON format as shown below.

Transcript and Summary Feed: Provides full transcripts alongside AI-generated company-level summaries.

      matched_company_name : NVIDIA Corporation
      ticker : NVDA
      company_id : 32307
      summary : NVIDIA was a major focus of the podcast, with Jensen Wong discussing its advancements in AI and robotics during his CES keynote. He highlighted the potential for new trillion-dollar market opportunities in agentic AI and self-driving cars. NVIDIA's self-driving platform is being utilized by Toyota, which could make them a significant customer. The discussion also touched on the Blackwell AI chip and its applications in consumer electronics, although there are concerns about stock performance in relation to upcoming employment numbers and interest rates.

▼ 2 {5}
  matched_company_name : Toyota Motor Corporation
  ticker : TM
  company_id : 319676
  summary : Toyota was mentioned as a potential major customer for NVIDIA's self-driving platform, indicating their significant investment
    in technology. Jensen Wong noted that Toyota has the firepower to become a key player in the market for AI and robotics.
  relevance_score : 70

▼ 3 {5}
  matched_company_name : ServiceNow, Inc.
  ticker : NOW
  company_id : 22967487
  summary : ServiceNow was referenced alongside Salesforce in the context of agentic AI, suggesting that similar AI technologies could be
    applied within their platform. However, this mention was also brief and not a primary focus of the podcast.
  relevance_score : 20

transcript : Hey, it's Kramer, and this is my morning take on the market from today's CMBC Investing Club morning meeting. Let's focus on
  NVIDIA first, because obviously that was such a big story last night. Jensen Wong, his CES keynote, declaring that the chat GPT
  moment for general robotics, just around the quarter, agentic AI, self-driving cars, humanoid robots, all you know, really just
  kind of the next frontier, these new trillion-dollar market opportunities, Jensen explained. Well, I'm going through both the
  blogs and the blogs were all available, and watch, of course, the presentation. It was excellent. And the major theme here is
  that those who believe that these guys are going to be in a dogfight with Amazon, they're leaving that behind. They'll still make
  those chips. But they have, for instance, a huge data center in Tennessee with Musk for Tesla. He basically said that Toyota is
  going to do the same thing. Toyota's, they have big firepower. They can become the next biggest customer, and the Chinese are
  going to be customers. And I just find that when you listen to it, what he's saying is we may all have robots, and it may happen
  much sooner than we expect. Because the robots are going to be humanoids. And therefore, things like the Salesforce, things where
  you have an agentic agent that is basically going to be onboarded to your company with ServiceNow satellite. Well, that's the new
  world. And the new world was doing well, and then the rates went bad, and we don't care about the new world. Today, we don't care
  about it. And Toyota, that was a nice win. They're using NVIDIA self-driving platform. Jensen also talked about Blackwell in full
  production. Every cloud service provider has systems up and running. A new personal AI supercomputer, which is a desktop with the
  Blackwell AI chip inside, $3,000, so pricey. But a lot of, of course, this was the consumer electronics. So, a lot of consumer-
  facing products here. Would I buy NVIDIA down for? Look, I know you remember you got the jobs report on Friday. We could see a
  similar move to 4.75. That would cause people to sell NVIDIA. So, you actually have to do is say, listen, maybe I buy some, but I
  leave room just in case the employment number is weak. Meaning, causes weakness in the stock market. A strong employment number
  is going to drive interest rates up and cause you to lose again. So, a little bit of a good news, it's bad news might be where
  we're at. Exactly. I mean, look, what I'm surprised about is that we've had a number of numbers that were much weaker than these.
  So, then you want to figure out: are they outliers? And then you want to figure out: well, hold it just a sec. Like, healthcare

Field Descriptions

Column Name	Description
postID	Unique Identifier for individual podcast episode.
episode_title	Podcast Episode Title
episode_description	Podcast Episode Description
podcast_show_title	Name of Podcast Show
episode_audio_length_sec	Audio Length of the Podcast in seconds
postedTS	UNIX TimeStamp of Podcast Release
posted_date	Date of Podcast Release
matched_company_name	Company Name of Security
ticker	Security Symbol
company_id	S&P CIQ Company ID
sentiment_id	ID Mapping to Sentiment Metrics in Quantitative Data Feed
summary	AI Generated Summart for the security in a given podcast.
relevance_score	Rating 0-100 How much of a focus was the security in the whole podcast (AI Generated)
transcript	Automatic Speech Recognition model derived transcript of podcast audio.

Quantitative Sentiment Feed: Delivers a suite of security-level sentiment scores for each episode

For mapping to the Transcript & Summary Feed, postId and sentiment_id will serve as unique identifiers used to link company-level summary sentiment metrics.
